

1. Palindrome Function

```
function isPalindrome(str){

    let arrStr = str.toLowerCase().split('');

    let cleanedStr = '';

    for(let i = 0; i < arrStr.length; i++){

        if ((arrStr[i] >= `a` && arrStr[i] <= `z`) ||

            (arrStr[i] >= `A` && arrStr[i] <= `Z`) ||

            (arrStr[i] >= `0` && arrStr[i] <= `9`)){

                cleanedStr += arrStr[i];

            }

        }

        return cleanedStr ===

        cleanedStr.split('').reverse().join('');

    }

    console.log(isPalindrome(`Kasur rusAk`));
    console.log(isPalindrome(`madam, I'm adam`));
    console.log(isPalindrome(`Saya makan`));
```

2. Checking camelCase Function

```
function camelCase(str){
    let result = 1;
    let words = str.split(' ');
    let upperCase = str.toUpperCase().split(' ');
    for(let i = 0; i < words.length; i++){
        if(upperCase[i] === words[i]){
            result++;
        }
    }
    return result;
}

console.log(camelCase(` saveChangeInTheEditor`));
console.log(camelCase(`oneTwoThree`));
```

3. Count the Deletion

```
function alternatingCharacters(string){
    let deleted = [];
    let before = '';
    for(let i = 0; i < string.length; i++){
        if(before.length == 0 || string[i] != before){
            before = string[i];
        }else if(string[i] == before){
            deleted.push(string[i]);
        }
    };
    return deleted.length;
}

console.log(alternatingCharacters(`ABABABAB`));
console.log(alternatingCharacters(`AAAAA`));
console.log(alternatingCharacters(`BBBBBBB`));
console.log(alternatingCharacters(`AAABB`));
```
